Description

The OM 472RTD model is a 4 3/4 digit panel programmable thermometer for sensors Pt 100/500/1 000, Ni 1 000.

The instrument is based on an 8-bit controller with very precise A/D converter, that secures high accuracy, stability and easy operation of the instrument.

Standard functions

Programmable input

Type Pt 100/500/1 000, Ni 1 000
Projection -200.0°...850.0° C

Compensation

Conduct for 2-wire connection
Probes internal connection (conduct resistance in the measuring head)

Digital filters

Floating average from 2...30 measurements
Exponen. average from 2...128 measurements
n-th value from 2...255 measurements
Radius of insensitiv. band of suppressed change of measured value

Mathematic functions

Min/max. value registration of min./max. value reached during measurements
Tare designed to reset display upon non-zero input-signal
Top value the display shows only max. (min.) value for a selected time period
Round up/down setting the projection step for display
Math. operations polynome, 1/x, logarithm, exponential, power, root, sin x

External control

Hold display/instrument blocking
Lock control keys blocking
Tare tare activation
Resetting MM resetting min/max value to zero

Operation

The instrument is set and controlled by five control keys located on the front panel. All programmable settings of the instrument are realised in two adjusting modes.

Configuration menu (hereinafter referred to as CM) is protected by an optional number code and contains complete instrument setting

User menu may contain arbitrary programming settings defined in „CM“ with another selective restriction (see, change)

All programmable parameters are stored in the EEPROM memory (they hold even after the instrument is switched off). The display shows the measured units (°C/°F/K).

Options

Comparators are assigned to monitor one, two, three or four limit values with relay output. The user may select limits regime: LIMIT/DOSING/FROM-TO. The limits have adjustable hysteresis within the full range of the display as well as selectable delay of the switch-on in the range of 0...99,9 s. Reaching the preset limits is signalled by LED and simultaneously by the switch-on of the relevant relay.

Data outputs are for their rate and accuracy suitable for transmission of the measured data for further projection or directly into the control systems. We offer an isolated RS232 and RS485 with the DIN MessBus/ASCII protocol.

Analogue outputs will find their place in applications where further evaluating or processing of measured data is required in external devices. We offer universal analogue output with the option of selection of the type of output - voltage/current. The value of analogue output corresponds with the displayed data and its type and range are selectable in CM.

Real time is an internal time control of data collection. It is suitable everywhere where it is necessary to register measured data in a given time segment. Up to 65 000 values may be stored in the instrument's memory. Data transmission into PC via serial interface RS232/485.
